

Homework 6

Combinatorics

You are allowed and encouraged to work together on homework. Yet, each student is expected to turn in his or her own work. In general, late homework will not be accepted. However, you are allowed to turn in **up to two late homework assignments with no questions asked**.

Reviewing material from previous courses and looking up definitions and theorems you may have forgotten is fair game. However, when it comes to completing assignments for this course, you should *not* look to resources outside the context of this course for help. That is, you should not be consulting the web, other texts, other faculty, or students outside of our course in an attempt to find solutions to the problems you are assigned. This includes Chegg and Course Hero. On the other hand, you may use each other, Discord, me, and your own intuition. **If you feel you need additional resources, please come talk to me and we will come up with an appropriate plan of action.** Please read NAU's [Academic Integrity Policy](#).

Complete the following problems.

- Recall the definition of multiset given on Homework 5. For fixed $n \in \mathbb{N}$, let $M_n(t)$ denote the generating function for the number of multisets of $[n]$ of size k :

$$M_n(t) := \sum_{k \geq 0} \binom{n}{k} t^k.$$

Also, define $\mathcal{M}_n := \{A \mid A \text{ is a multiset on } [n]\}$.

- Explain why $M_n(t) = \sum_{A \in \mathcal{M}_n} t^{|A|}$, where $|A|$ is the size of the multiset A .
- Explain why $\sum_{A \in \mathcal{M}_n} t^{|A|} = (1 + t + t^2 + \dots)^n$.
- Explain why $M_n(t) = \frac{1}{(1-t)^n}$.

Hint: For part (b), notice that if you were to expand $(1 + t + t^2 + \dots)^n$, each resulting term (prior to collecting like terms) corresponds to choosing a term from each of the n factors and then multiplying them together. Each such product of choices corresponds to a unique multiset. In particular, think of the i th factor of $(1 + t + t^2 + \dots)^n$ as corresponding to $i \in [n]$. Choosing t^j in the i th factor corresponds to having i occur with multiplicity j in a multiset.

- Give a combinatorial or bijective proof that $\binom{n}{1} = 2^n - n - 1$.
- Prove that the following permutation statistics are Eulerian. Complete any *two* of the following.
 - The number of *ascents* of a permutation w , $\text{asc}(w) := |\{i \mid w(i) < w(i+1)\}|$.
 - The number of *maximal increasing runs* of a permutation, denoted $\text{runs}(w)$, where a maximal increasing run is a substring $w(i) < w(i+1) < \dots < w(i+r)$ such that $w(i-1)$ is not smaller than $w(i)$ and $w(i+r)$ is not smaller than $w(i+r+1)$.
 - The number of *excedances*, $\text{exc}(w) := |\{i \mid w(i) > i\}|$.

- (d) The number of inversion sequences of length n counted according to ascents, where an *inversion sequence* of length n is a vector $s = (s_1, \dots, s_n)$ such that $0 \leq s_i \leq i - 1$ and $\text{asc}(s) := |\{i \mid s_i < s_{i+1}\}|$.
4. We define a **barred permutation** on n as follows. Given $w \in S_n$, we must place at least one vertical bar after each descent position and we can place finitely many additional vertical bars in gaps that do not correspond to descents. For example, $1|5|237||46$ is a barred permutation with 4 vertical bars. A single vertical bar was required after 5 and 7, respectively, and the other two bars were optional.
- (a) Explain why there is a bijection between the collection of barred permutations on n with k bars and the collection of configurations of n labeled balls into $k + 1$ labeled boxes.
- (b) Fix $n \in \mathbb{N}$. Prove that the generating function for the number of barred permutations that have a fixed $w \in S_n$ as their underlying permutation is given by

$$\frac{t^{\text{des}(w)}}{(1-t)^{n+1}}.$$

Hint: As an example, the barred permutation $1|5|237||46$ corresponds to placing 7 balls into 5 boxes such that the first box contains ball 1, the second box contains ball 5, the third box contains balls 2, 3, 7, the fourth box is empty, and the fifth box has balls 4 and 6. The underlying permutation for this example is $w = 1523746$. For part (b), mimic the approach we took in Problem 1(b). Utilize a factor of $1 + t + t^2 + \dots$ when there is no descent and a factor of $t + t^2 + t^3 + \dots$ if there is a descent.
